Audio To stand alone the MIDI jack action does not require connection. MIDI allows triggered rhythms and HR-16 programming of external MIDI devices, such as keyboards or drum pads that are equipped with MIDI. Also, MIDI can be used Sync different devices to HR-16, store and recall memory using the external disk drive via the unique MIDI data dump system, and get the program changing commands that call up patterns. The program change command is useful for accessing different sets of sounds when Trigger sounds from drum pads or trails. If the new app change order is received while HR-16 is in PLAY mode, The program number is the next pattern to choose from to play after the current pattern All. HR-16 has two stereo outputs (four individual outputs). The volume slider is only active on the first stereo output (Output 1). In addition, if only one side of an output is connected, the dedicated stereo mick on that stereo output becomes a mono mixture on that single output. This saves the need to reconstruct the mono mixture from the stereo mixture, when only one output is only in use. Using four outputs, assign the hit to output 2 panned hard left and snare to output 2 The right was hard. This leaves all the other drums on the output of 1 pan in the stereo as desired and hit and snare dedicated to your output. To learn more about setting up drum and trailing devices, look at mmt-8 BASIC SET UP in the MMT-8 instruction manual. Alesis HR - 16 Instructions Page 4 of this manual relates to the following products:
